GROWING TOGETHER FOR
HEALTH AND HAPPINESS

HIV

HIV stands for *Human Immunodeficiency Virus*. A tiny virus that can affect people and can make the immune system low (deficient), unless we use medicines that manage HIV.

CD4 cells

CD4 cells are tiny but important – they are a type of white blood cell and part of your immune system. Without HIV medicines, HIV can use CD4 cells to make more HIV – which makes the amount of CD4 cells in your body lower.

HIV medicines

HIV medicines stop HIV from attaching to CD4 cells and making more HIV. When HIV medicines are working, the amount of HIV goes so low it cannot be seen on your blood test.
